

Managing Data in Docker: Persistence Volumes and Mounting Best Practices

1. Create A Docker Server on EC2.

The screenshot displays the AWS Management Console interface for an EC2 instance. The instance is named "Docker-Server" and is in a "Running" state. The instance details show a public IPv4 address of 43.205.144.209, which is highlighted with a red box. The instance is located in the ap-south-1a availability zone. The console also shows the instance's state as "Initializing" and provides a link to "View alarms".

```
root@ip-172-31-43-166:~# docker --version
Docker version 28.2.2, build 28.2.2-0ubuntu1~24.04.1
root@ip-172-31-43-166:~#
```

PublicIPs: 43.205.144.209 PrivateIPs: 172.31.43.166

2. Create A Docker Persistence Volume and Attached to Container.

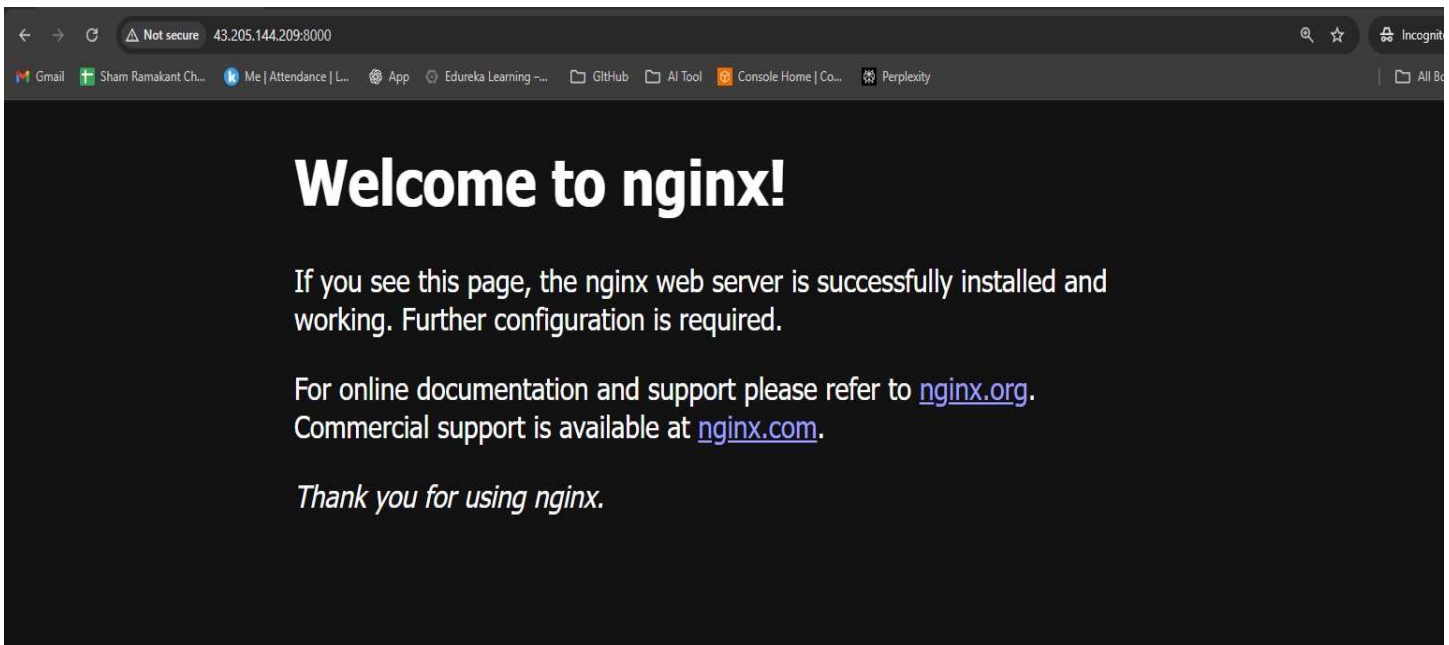

```
aws

Account ID: 6972-2744-0009
Sham AWS

root@ip-172-31-43-166:~# docker volume create my-volume
my-volume
root@ip-172-31-43-166:~# docker volume ls
DRIVER      VOLUME NAME
local       my-volume
root@ip-172-31-43-166:~#
```

```

DRIVER      VOLUME NAME
local       my-volume
root@ip-172-31-43-166:~# docker run -d -p 8000:80 -v my-volume:/usr/share/nginx/html nginx

3. Made The Changes in Persistence Volume and Verify with Container.

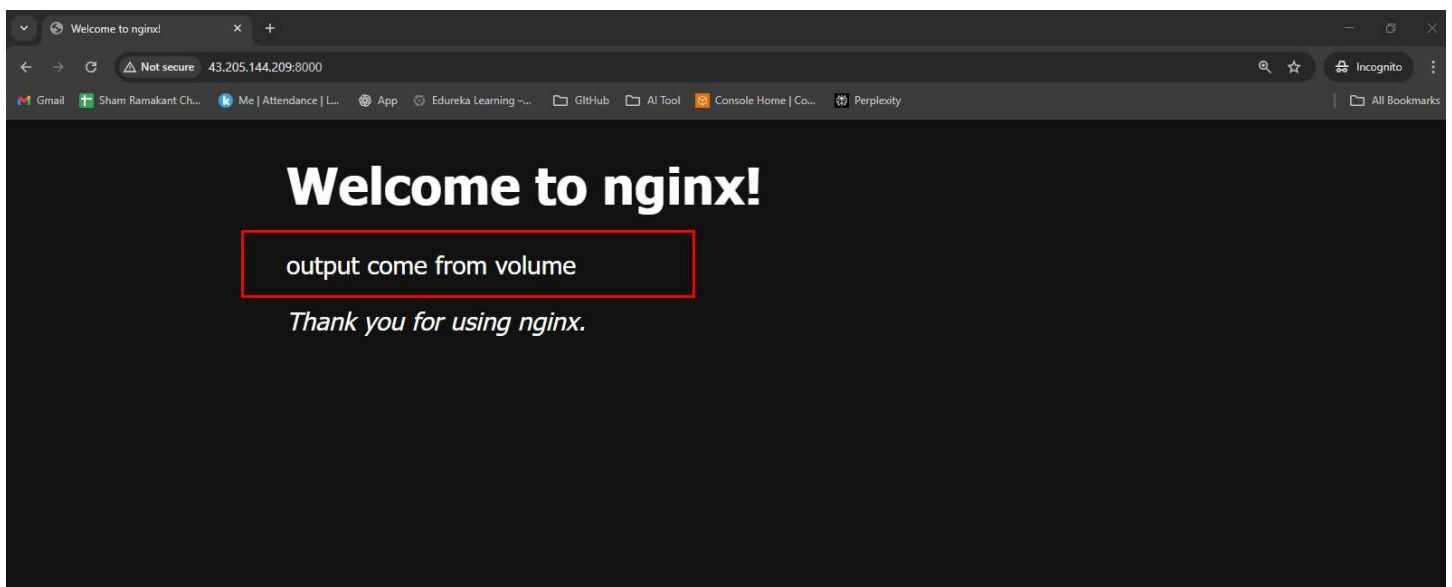

```
root@ip-172-31-43-166:~# cd /var/lib/docker/volumes/my-volume/

4. Create A Mount Volume and Attached to Container.

```
root@ip-172-31-43-166:~# mkdir Mount-volume
